

# An Introduction to Credit Derivatives and CDSW pricing

Abukar M Ali  
December 2002

# Training outline

- Development of the Credit Derivatives Market
- Types of Credit Derivatives
- Credit Default Swap Structure:
  - Definitions and terminology
- CDSW Pricing Techniques
- Summary

# Development of the Credit Derivatives Market

- Existing exchange traded derivative products are used to control macro-related risk: futures, options, futures on swaps, etc.
- Instrument needed to eliminate firm-specific credit risk/non systematic risk
- Eg., ENRON

# Credit derivative volume (\$ bln)

Source: BBA

# Types of Credit Derivative Instruments

- Credit Default Swap
- Total Return Swap
- Credit Spread Option
- Basket Default Option
- Credit Linked Note

# Credit Default Swap Structure

- **Definition:** Payment by one party in exchange for a credit default protection if a credit default event occurs/triggered. Think of this as Auto/Home insurance.
  - Similar pay off features as PUT OPTION
  - Or, Exotic type option with Knock in feature such as BARRIER OPTION
- **CDSW Structure**
  - Default Swap Premium
  - Contingent payment

$$\sum_{t=0}^T q(t)\Delta t$$

# CREDIT DEFAULT SWAP PRICING

## MODIFIED HULL & WHITE MODEL

### SOME NOTATION:

$P(0,T)$  = Price of risk-free discount bond maturing at time T

$q(0,T)$  = Conditional default probability at time T

$Q(T)$  = Cumulative default probability at time T

$$\text{and } Q(t) = \sum (q_t) \Delta t$$

$1-Q(T)$  = Survival probability at time T

$C_R(T)$  = Risky par coupon for maturity T  
(risk free rate + credit spread)

( 1- R) where R is recovery rate

# CREDIT DEFAULT SWAP PRICING

## MODIFIED HULL & WHITE MODEL

We start off stripping procedure to drive cumulative default probabilities via risk par curve:

$$100 = \sum_i [1 - Q(t_i)] C_R(t) \Delta t P(0, t_i) + 100 [1 - (Q(t_i))] P(0, t_i) + R 100 \sum_i q(t_i) \Delta t P(0, t_i)$$

To price the contract, the swap can be broken down into two legs of cash-flows:

# CREDIT DEFAULT SWAP – MODIFIED HULL & WHITE MODEL

- A) Constant periodic payment  
(the CDS spread:  $S_{\text{CDS}}$ )

$$S_{\text{CDS}}(T) \sum_i [1 - Q(t_i)] P(0, t_i) \Delta t$$

- B) Expected payoff assuming a recovery rate of  $R$ :  $100(1-R) \sum_i q(t_i) \Delta t P(0, t_i)$

Solution:

$$S_{\text{CDS}}(T) = \frac{100(1-R) \sum_i q(t_i) \Delta t P(0, t_i)}{\sum_i [1 - Q(t_i)] P(0, t_i) \Delta t}$$

# Bloomberg screen CDSW

- The following screen shows page CDSW for pricing credit default swaps using either Hull-White or generic JPMorgan model
- The JPM model assumes two cash flows to present-value: the premium and the reciprocal premium if one is hedging the CDSW (these will be different: the CDSW bid-offer spread)
